

**Question: create a PHP website with the following descriptions:**

Create a database table called **Company** with the following fields:

- Id
- Company name
- Address

Create a database table called **Employee**, with the following fields:

- Id
- Name
- Salary
- Date of Birth
- Company

Create following PHP page:

- CRUD operations for "company"
- CRUD operations for "employee"

For create pages, perform input field validations like: check if field is empty or null, show warning message just below input field, with appropriate message . [or for salary fields perform validation like salary should be greater than 10,000 and less than 50,000] .

Write javascript code for the above front-end input field validation

Write PHP code to allow only authenticated "user" to access the above created pages.
